

LEADING AIMS

- Improvement of hygiene and quality of living
- Closing of material cycles / recycling
- Waste separation
- Adding new jobs

ANALYSIS OF THE CURRENT SITUATION

- The waste is being collected every two days by the state company BELACAP, the access to many houses unfortunately is barricaded by illegal branched off electrical cables. That's the reason why garbage and rubble pile on the streets of the vila. The consequences are soil and water pollution, methane accrues, diseases spread.
- Organic remains, domestic and construction waste are being deposited along the riversides and change the water quality and the biotop for creatures.

METHODS OF RESOLUTION

- Organised refuse collection by means of carriages, which can reach even the narrowest streets and blind alleys
- Stimulation for the people to separate their domestic waste - for example by giving them gas bottles for free.
